Events Dataset

Row Counts

Total rows read: 10000

Rows after cleaning: 10000

Rows dropped: 0

Missing Values in Events

Column	Missing Count
--------	---------------

Duplicates

Fully duplicate rows found: 0

Schema Issues

- Invalid event types: 0
- Price not numeric: No

Range and Format Issues

- Price <= 0: 0
- Future event_time: 0
- Empty user_session: 0

Users Dataset

Row Counts

Total rows read: 1000

Rows after cleaning: 1000

Rows dropped: 0

Missing Values in Users

Column	Missing Count
--------	---------------

Duplicates

Duplicate user IDs found: 0

Schema Issues

- Age not numeric: No

Range and Format Issues

- Age outside 0-100 range: 0

Products Dataset

Row Counts

Total unique products: 100

Missing Values in Products

Column	Missing Count
--------	---------------

Duplicates

Duplicate product IDs found: 0

Summary

Overall, the validation process cleaned 11000 rows of data across events and users datasets. A total of 0 rows were dropped (0.0% of the original data).

Most of the data quality issues were related to missing values in optional fields (like city and gender for users, which were filled with 'unknown'), invalid event types, and rows with price <= 0. The events dataset had 0 rows removed,

primarily due to invalid event types, pricing issues, and duplicate entries. The users dataset had 0 rows removed, mainly due to invalid age values outside the 0-100 range.

After cleaning, the final validated datasets contain 11000 rows of high-quality data ready for feature engineering and analysis.
